

This is a suggested schedule using combination vaccines. For alternatives, details and catch-up, refer to the most current "Recommended Immunization Schedules" from CDC.

- 1 A dose of HepB vaccine is not necessary at 4 months if doses are given at birth and 2 months, but may be included as part of combination vaccine.
- 2 The 6 month dose is not needed if Rotarix is used exclusively for both dose 1 and 2 in rotavirus vaccine series.
- 3 The 6 month Hib dose is not needed if PedvaxHIB is used exclusively for the 2nd and 4th month doses.
- 4 CDC recommends administration of separate MMR and Varicella vaccines for the 12-15 month dose; however MMRV is acceptable based on clinical discretion.
- 5 ACIP recommends whenever feasible that the same manufacturer's DTaP be used for each dose in the series, however vaccination should not be delayed based on the type of DTaP previously administered.
- 6 The child may need 1 or 2 doses of flu vaccine based on previous vaccination history. Refer to most current influenza recommendations.
- 7 Licensed for children 4-6 years. ACIP recommends using the same manufactuer's DTaP vaccine for each dose in the series, but vaccination should not be deferred because the previous dose of DTaP is unavailable or unknown.
- 8 Licensed for children 6 weeks-4 years of age (prior to the 5th birthday).
