## Executive Summary

Iowa's 2018 Report on Community Water Fluoridation provides information on the fluoride status of Iowa's water supplies. This report is designed to assist local public health professionals, dental and medical professionals, and the public to make informed decisions about their oral health.

Community water fluoridation is the precise adjustment of natural fluoride levels in water to the optimal level of 0.7 mg/L<sup>1</sup> to prevent tooth decay. Some benefits of community water fluoridation:

- ❖ It is a cost effective way to prevent and reduce tooth decay. The annual return on investment for water fluoridation is between \$5 and \$32 for every \$1 spent, depending on community size.<sup>2</sup>
- ❖ It provides a reduction in tooth decay by at least 25 percent throughout a person's lifetime.<sup>3</sup>
- ❖ It provides a lifetime of safe tooth decay prevention regardless of age, income, or education.

In 2018, there were 1,068 public water systems serving 2,833,395 Iowa residents; 148 systems adjusted their fluoride level, serving 1,603,188 people; 485 systems did not adjust their fluoride level and serve 263,573 people (Table 1).

	<b>Number of Systems</b>	<b>Population Served by System</b>
All Water Systems	1,068	2,833,395
<b>Fluoridated</b>		
Adjusted	148	1,603,188
Natural	201	385,019
Defluoridated	1	1,692
Consecutive	192	435,752
Multi-Source	9	128,586
<b>Total</b>	<b>551</b>	<b>2,554,237</b>
<b>Non-Fluoridated</b>		
Non-Adjusted	485	263,573
Consecutive	32	15,585
<b>Total</b>	<b>517</b>	<b>279,158</b>

Of the Iowa residents served by a community water system, 90.2 percent received fluoridated water. However, only 69.9 percent of that 90.2 percent received optimal (0.6-1.2 mg/L) fluoridated water to prevent tooth decay on a daily basis, a 9.9 percent increase from 2017.

To find the fluoride level in a certain community visit the CDC website, [My Water's Fluoride](https://www.cdc.gov/fluoridation/index.html). This website is updated monthly by the Iowa Department of Public Health.

## List of Acronyms

CDC .....	Centers for Disease Control and Prevention
CWF .....	Community Water Fluoridation
DNR .....	Iowa Department of Natural Resources
EPA .....	Environmental Protection Agency
IDPH .....	Iowa Department of Public Health
MCL .....	Maximum Containment Level
WFRS .....	Water Fluoridation Reporting System

## Glossary

The following terms are used to describe the fluoridation status of community water systems.

**Adjusted:** A water system that adds fluoride to achieve optimal fluoride level of 0.7 mg/L.

**Consecutive:** A water system that purchases water from another water system. The consecutive water system has a water plant, but does little or no treatment to the water. These water systems are optimally fluoridated if the original (i.e., parent) system is optimally fluoridated. No additional fluoride is added to the consecutive system.

**Defluoridated:** A water system that has very high natural fluoride levels, over 4 mg/L. They are required by the Environmental Protection Agency (EPA) to remove fluoride until they are below the Maximum Containment Level (MCL). One system in Iowa defluoridates but mixes raw water in to achieve an optimal level of fluoridation.

**Multi-Source:** A water system that receives water from numerous sources. It may get water from two or three other water systems and also provide some water itself through its own wells. The fluoridation status depends on the fluoridation status of the different water systems. No additional fluoride is added.

**Natural:** A water system that has a natural fluoride concentration at or above 0.6 mg/L. No fluoride is added to the system.

**Non-Adjusted:** A water system that has a natural fluoride level at or below 0.59 mg/L. No fluoride is added.

## Iowa's Fluoride Status Report

Iowa's 2018 Report on Community Water Fluoridation provides information on the fluoride status of Iowa's water supplies. This document is designed to assist local public health professionals, dental and medical professionals, and the public to make informed decisions about their oral health.

Community water fluoridation is the precise adjustment of natural fluoride levels to 0.7 mg/L<sup>4</sup>, the optimal level to prevent tooth decay. All water, including ground, surface, and sea water has fluoride, but the level is usually less than the optimal amount. Tooth decay is a very common, chronic, preventable disease that affects all ages. One in five people has untreated tooth decay<sup>5</sup> which impacts employment, social development, self-esteem, and overall quality of life.

Some benefits of community water fluoridation:

- ❖ It is a cost effective way to prevent and reduce tooth decay. The annual return on investment for water fluoridation is between \$5 and \$32 for every \$1 spent, depending on community size.<sup>2</sup>
- ❖ It provides a reduction in tooth decay by at least 25 percent throughout a person's lifetime.<sup>3</sup>
- ❖ It provides a lifetime of safe tooth decay prevention regardless of age, income, or education.

This census includes only public water supplies and not private wells. A public water supply is considered a community water system if it has a minimum of 15 service connections used by year-round residents or regularly serves at least 25 year-round residents. Examples include cities, homeowners associations, mobile home parks, rural water systems, universities, and nursing homes.

The fluoride concentrations provided in this report are a snapshot in time. If a water system's level of fluoride is adjusted, a reading of the fluoride level must be taken every day at the treatment plant. That data, by law, must be provided to the Iowa Department of Natural Resources (DNR) on a monthly basis. The Iowa Department of Public Health (IDPH) works with water operators and the DNR to receive these reports in order to monitor and enter the fluoride data into the Centers for Disease Control and Prevention (CDC) Water Fluoridation Reporting System (WFRS) website. The public can access this information through the CDC website, *My Water's Fluoride*. If the water system does not fluoridate, is consecutive, or is considered natural, the fluoride level must be tested at least once every three to nine years; a monthly report is not required to be sent to the DNR.

In 2018, there were 1,068 public water systems serving 2,833,395 Iowa residents; 148 systems adjusted their fluoride level, serving 1,603,188 people; 485 systems did not adjust their fluoride levels and serve 263,573 people.

Of the Iowa residents served by a community water system, 90.2 percent received fluoridated water. However, IDPH can only verify that 69.9 percent of that 90.2 percent received optimal (0.6-1.2 mg/L) fluoridated water on a daily basis, due to the fact that not all adjusted water systems add the appropriate daily amount of fluoride to stay within optimal range and/or the water system is not within optimal range for at least nine months of the year. In 2017, IDPH could verify that 63.7 percent of Iowans served by a community water system were receiving optimally fluoridated water, an increase by 9.9 percent for 2018.
