Magnitude of Fall-related Injuries among Older Adults in Iowa

Understanding Falls

Falls are one of the leading causes of injury hospitalization and deaths among Iowa older adults. A fall is an event which results in a person coming to rest unintentionally on the ground or floor or other lower level.¹ Millions of adults aged 65 and older fall each year in the United States alone.¹ One out of three older adults falls each year, but about half of those who fall never reported or discussed their falls with a health care provider.² Lifetime costs associated with unintentional fall injuries between 2010-2014 among Iowa residents ages 65 and older are estimated to be over \$3.5 billion. Most of these costs were associated with injuries requiring emergency department visits. Falls can cause moderate to severe injuries, such as hip fractures and traumatic head injuries, and have been shown to increase the risk of early death. Some risk factors that are associated with falls are lower body weakness, vitamin D deficiency, vision problems, and home hazards such as broken or uneven steps or no handrails along stairs.² Although falls are a serious public health issue, many falls are preventable.

The Impact of Falls in Iowa

In Iowa, between 2010 and 2014, there was a total of 141,635 deaths. Approximately 2,323 (15.1 deaths per 100,000 population) of these deaths were associated with falls. Of the total deaths from falls, nearly 201 deaths (6.5 deaths per 100,000 population) were among people between the ages of 50 and 64. People ages 65 and older had the highest total number of deaths, nearly 2,020 deaths (85.9 deaths per 100,000 population).

There was a total of 54,447 hospitalizations (3.59 hospitalizations per 1,000 population) due to falls between 2010 and 2014. The hospitalization rate for people ages 50 to 64 was 2.73 per 1,000 population and 17.24 per 1,000 population among people ages 65 and older. This indicates that people ages 65 and older had the highest rate of hospitalization compared to people ages 50 to 64. Between 2010 and 2014, among all 99

Highlights

- ✓ Nearly 1 out of 3 older adults fall each year, but half of those who fall never reported or discussed their falls.
- ✓ Between 2010-2014, lifetime costs associated with fall injuries among Iowans ages 65 and older were over \$3.5 billion.
- ✓ Falls risk factors includes lower body weakness, vitamin D deficiency, vision problem, and home hazards (broken or uneven steps or no handrails).
- ✓ In Iowa, between 2010-2014, hospitalization charges due to falls were about \$1.62 billion.
- ✓ Between 2010-2014, 141,635 deaths were recorded in Iowa, and approximately 2,323 of those deaths were associated with falls.

Iowa counties, Howard County had the lowest rate of hospitalizations for people ages 65 and older (3.24 per 1,000 population) due to falls compared to Van Buren County (the highest at 31.3 per 1,000 population).

In 2010-2014, hospitalization charges due to falls in Iowans were about \$1.62 billion. The average charge per hospitalization (for all ages) was \$29,847.86, which is 8 percent higher than in 2009-2013. Comparatively, the average charge for hospitalization due to falls for people ages 65 and older was \$28,486 (nearly 7 percent higher than in 2010-2013) versus \$35,585 (about 9 percent higher than in 2010-2013) for people ages 50 to 64. While the hospitalization rate for people ages 65 and older was six times greater than those ages 50 to 64, the average hospital charges were 20 percent lower than the average hospital charges for people ages 50 to 64 years old. Additional analysis is needed to understand the differences in average hospital charges. The data contained in this report were prepared using the Iowa Vital Records and the hospital discharge data. These data included fall-related cases that resulted in hospitalizations and deaths; therefore, the data presented in this report do not fully reflect the true magnitude of falls in Iowa.

Comparison of 2009-2013 and 2010-2014 Fall-Related Deaths Data

Table 1 illustrates the comparison of fall-related deaths, hospitalizations, and hospitalization charges. The 2010-2014 data showed a significant increase in fall-related hospitalization charges. Fall-related hospitalization charges increased 8 percent for both all ages and people ages 65 and older, and a 9 percent increase for people ages 50-64.

Table 1: Comparison of Iowa Fall-Related Data, 2010-2014

	2009-2013			2010-2014		
	All Ages	Ages 50-64	Ages 65+	All Ages	Ages 50-64	Ages 65+
Deaths (rate per 100,000 population)	14.6	6.0	84.3	15.1	6.5	85.9
Hospitalization (rate per 100,000 population)	3.5	2.6	17.4	3.6	2.7	17.2
Hospitalization Charges (average)	\$27,569	\$32,630	\$26,388	\$29,847	\$35,585	\$28,486

County Fall-Related Deaths

Table 2 shows the number and rate per 100,000 population of fall-related deaths in Iowa by county. Counties with the highest rate (42 – 46 deaths per 100,000 population) of fall-related deaths includes Johnson, Cerro Gordo, and Cass. Cedar, Fremont, Guthrie, Page, and Warren County had the lowest rate (< 3 fall-related deaths per 100,000 population) of fall-related deaths.

County Fall-Related Hospitalizations

Table 3 shows the number and rate per 100,000 population of fall-related hospitalizations in Iowa by county. Counties with the highest rate (6 - 7 hospitalizations per 100,000 population) of fall-related hospitalizations include Calhoun, Ida, Van Buren, and Wayne. Allamakee, Emmet, Howard, Osceola, and Sioux County had the lowest rate (< 2 fall-related hospitalizations per 100,000 population) of fall-related hospitalizations.

Conclusions

Falls among older adults are a major public health problem, with an average 404 deaths among Iowans over the age of 65 and an average of 40 deaths among people aged 50 to 64 years annually. Falls contribute to the rising medical charges experienced by many older adults in Iowa. In Iowa, the average fall-related hospitalization charges for adults 50 to 64 years old was \$35,585 for 2010-2014 compared to the average hospital charges for all ages (\$29,847). To reduce falls in Iowa, efforts at the local level need to focus on adults ages 50 and older who are especially prone to falls. It is imperative to recognize that nearly half of falls are underreported and that falls are preventable. Both the death data and hospitalization data do not include falls that were not reported, thus, leaving us unable to adjust the rates of falls accordingly within this population.
